Use of Internet in Health Care Research

Prof Oluwadiya KS www.oluwadiya.com

Introduction: The internet

- Greatest advancement in information processing since the invention of the printing press
- Use of the internet has become a necessity in health care- in fact a necessary part of our lives
- The computers have changed all things

0

Why do research?

- To add to knowledge
- To tell what we are doing
- To solve problems
- Course requirement
- Specialization/ promotion

Lecturers! "publish or perish"

Basic process of research

- Topic selection
- Literature search / review
- Method /materials/fund
- Data collection
- Data analysis
- Discussion of results
- Dissemination information

Traditional way of researching:

Topic selection

Source of topic or idea

- Thrust upon us
- II. Nagging problem
- III. Academic readings
- IV. Brainstorming

Problem

May be obsolete even as you conceive it- you are just in your small world

Traditional Literature search

Era of weeks/months of search

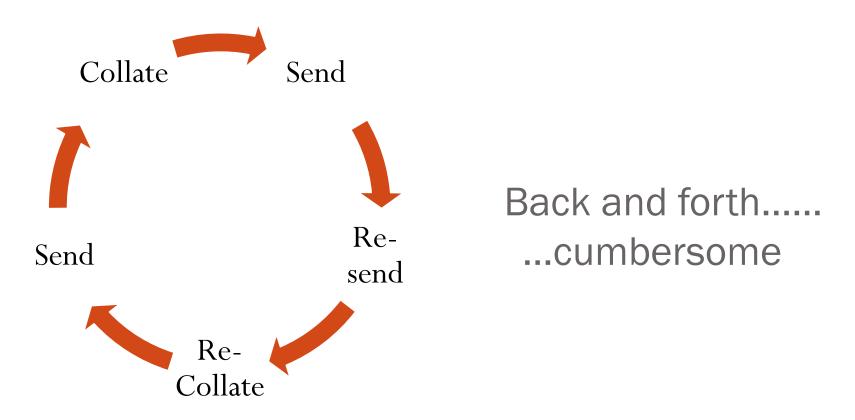

Problems

- Long hours
- How many libraries can I visit in a year?
- In what locations?
 - -certainly not the world over
- Language barrier
- Paper-difficult to manage

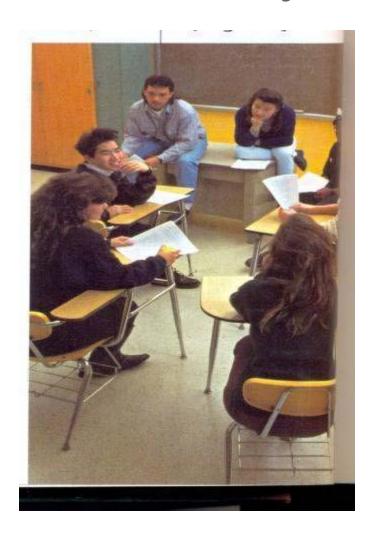

What about group research?

Collaboration is working together.

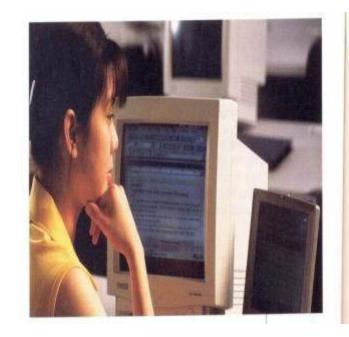

Tradition way of collaboration

- Not easy to get full house
- Questionnaire based ?— need to track down subjects —days and weeks
- Copies of manuscript more papers still
- DHL, NIPOST to ensure it gets there
- Correction- sending back and forth.
 Takes weeks and months

What about using the internet?

- A. The world is a village
- B. I can go from A to Z on my laps
- C. I just need to know how

LET US SEE HOW!!!

I. You will need a plan

The internet will be useful from the beginning to the end of your research

Using the internet from start to finish

I. Choosing research topic.

II. If you have one you can refine it . Is it hot or cold?

III. Getting the literature-Anywhere, language not a barrier. Web based translators.

IV. Questionnaire based – just have a site, send mails to invite subjects, etc

Using the internet from start to finish

V. Process the data & store - Get the software or use the web

VI. Collaborate with the world, online conferencing, webinars - remember CRASH 1 and 2

VII. Find appropriate journals and editors, proofreaders — Google it!

VIII. Send the manuscript - track the manuscript- review and resend and review over and over in minutes and hours, days.

You are the determinant!

You will need the right tools

Basic requirement: connectivity, browsers

Computer: PCs, Tablets, Smartphones, etc

Connectivity: "everywhere you go" or "rule your world", etc

A web browser: software for accessing internet retrieve and

present resources on the internet:

- Internet Explorer
- Mozilla Firefox
- Chrome
- Opera
- o Safari

You will need a means of searching the internet

Search engines and electronic libraries

SEARCH ENGINES(navigates the internet to locate information)

RETRIEVAL SYSTEMS

DATABASES: Internet repositories of data

- Medline
- Cochrane lib
- OVID
- SCORPUS
- CINAHL

Specialized Electronic Databases

- Although the topic area dictates the databases to be included, the following are common ones:
 - MEDLINE (General)
 - Cochrane Central (General)

Generally a minimum requirement for a thorough search of literature

- EMBASE (General, more international in scope)
- PsychLit/PsychINFO (Psychology)
- AIDSLine (HIV/AIDS)
- CINAHL (Nursing)
- TOXNET (Adverse Events/Toxicology)

You will need tools to write

Some Online Word processors

Google docs

https://docs.google.com/?hl=en&tab=wo

<u>&authuser=0&pli=1#home</u>

Microsoft Office 365

http://office.microsoft.com/en-us/web-apps/

You will need tools for data analysis

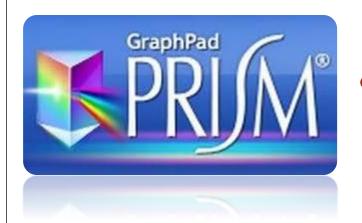

Online Statistics programs

SISA

http://www.quantitativeskills.com/sisa/

Graph pad

http://www.graphpad.com/quickcalcs/index.cfm

You need a place to store it all

Some online softwares and programs

DropBox

http://www.dropbox.com/

Sky Drive

https://skydrive.live.com/

Google Drive

https://drive.google.com/

Sugarsync

https://www.sugarsync.com/

And many, many, more

You need a tool to ease the pains of writing your reference

Online Reference Managers

zotero

EndNote Webwww.endnote.com

Mendeley
 <u>www.mendeley.com</u>

An Example:

Topic: Preoperative use of analgesic in acute abdomen

Searching Strategy I: What, Where & Who

- Define your information need
 - What sort of information are you looking for?
 - For general consumption?
 - Scientific?
 - What sources are appropriate?
 - Journal?
 - Encyclopaedia?
 - Dictionary?
 - Textbook?
 - Newspaper etc
 - Who is going to use the information?
 - Clinician
 - Researcher
 - Student
 - The lay public?

Searching Strategy I contd.

- For our Example
 - Our information need is scientific
 - Appropriate sources will be journals and sometimes textbooks
 - We will search healthcare databases. Use PubMed, CINAHL etc
 - Who is going to use the information?
 - This is mostly for clinicians, researchers, and sometimes, students.
 - The references must be reproducible

STRATEGY 2: Choosing your search terms

What are the key phrase /or unique words that might appear in a website or article?

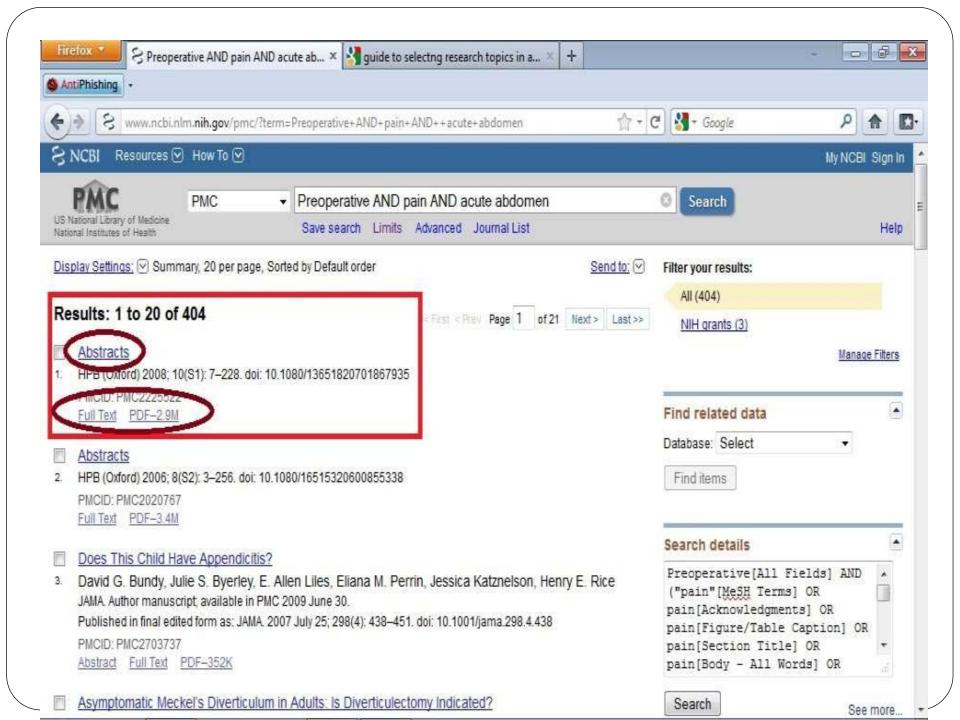

PREOPERATIVE, ANALGESIC, ACUTE ABDOMEN

Are there synonyms, alternate spellings, plurals or capitals that should be considered?

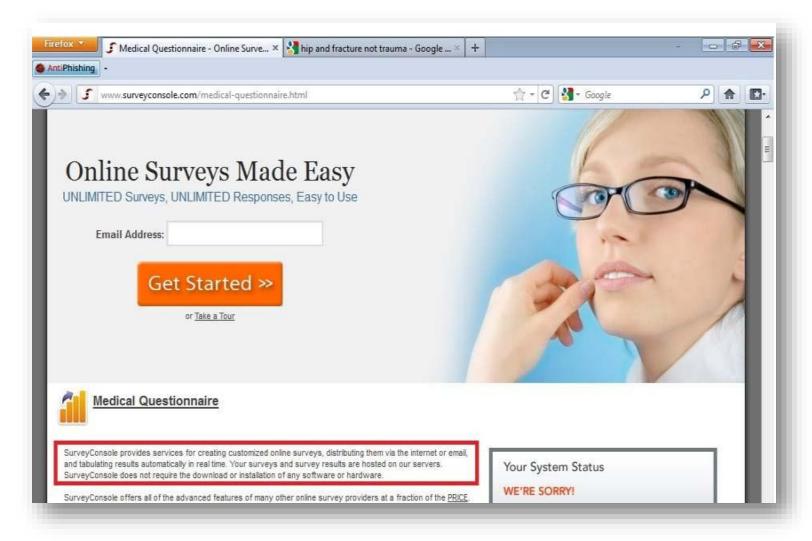

PERIOPERATIVE, BEFORE OPERATION, ANALGESIA, PAIN RELIEF, SURGICAL ABDOMEN, ACUTE ABDOMEN.

Let's Pubmed it!

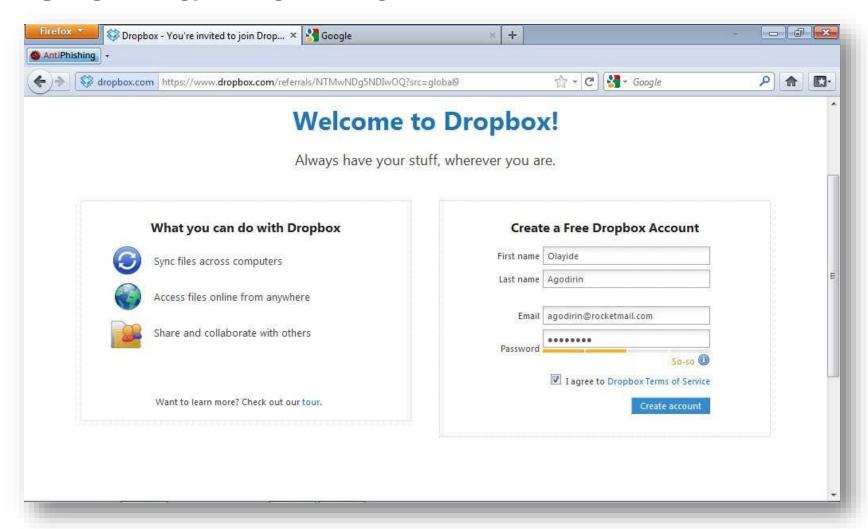

DATA COLLECTION: Online

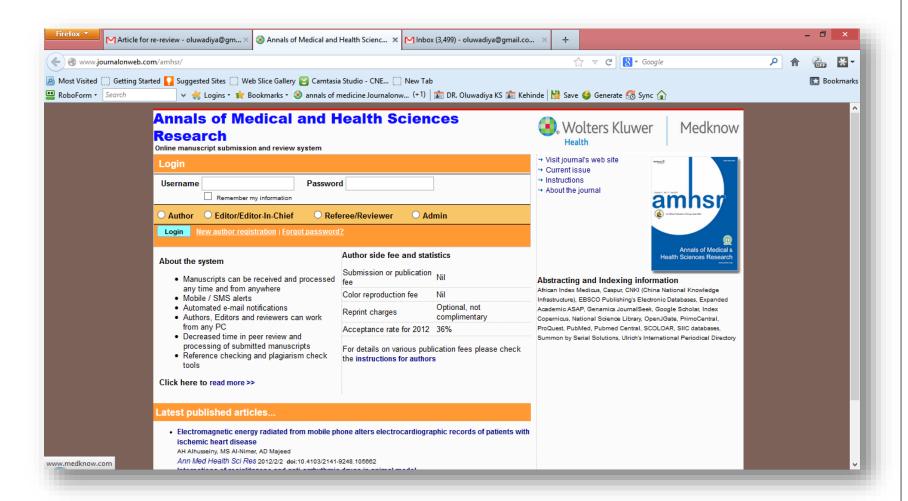

WRITING UP/ GROUP REVIEW: Online

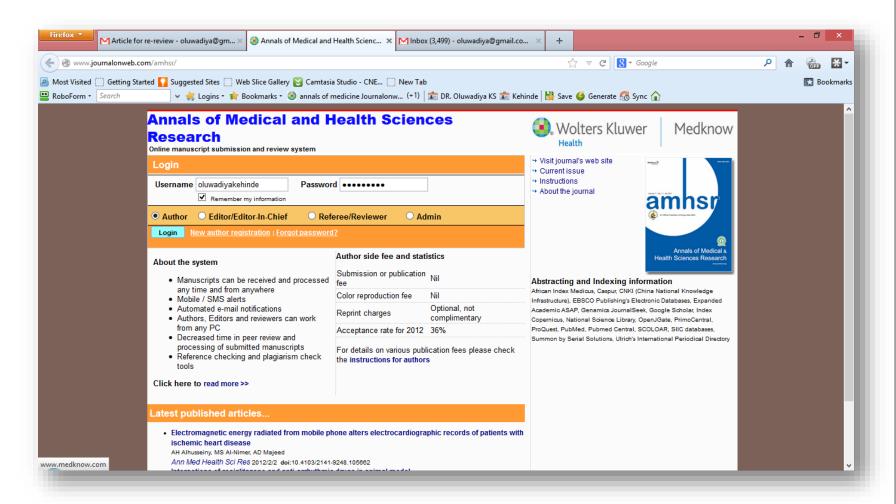

STORAGE: Online

CHOOSING YOUR JOURNAL: Online

SEND FOR PUBLICATION AND MONITOR: Online

WHEN YOU DO EVERYTHING ONLINE

• Cloud Computing: Using a network of remote servers hosted on the Internet to store, manage, and process data, rather than a local server or personal computer.

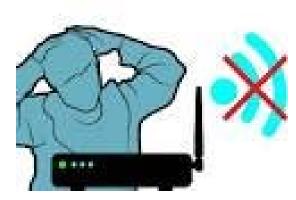

EVERY METHOD HAS ITS PROBLEMS

- ☐ Uncensored information- anybody can publish anything
- ☐ Information overload
- ☐ Questionnaire based- any body can pose, debriefing difficult
- ☐ Questionnaire based- DROPOUT rate higher and you won't know why!
- ☐ Expensive to remain online
- ☐ Plagiarism so much easier
- □ Not everything is online and not all are searched, it depends on the reaches of your search engine
- ☐ Malwares: Virus! Trojans!! Rootkits!!!:
- □ INTERNET ACCESS OUR OWN NO 1 PROBLEM

DRAW BACK 1 - CONNECTIVITY

Our own problems are — "everywhere you go", "rule your world", "your worst connection to the world"

→ beyond the common man/reasonable bandwidth expensive

Out there- it's expensive to organization to maintain libraries and networks, connectivity, IT staffs etc

→ competition will make it cheaper

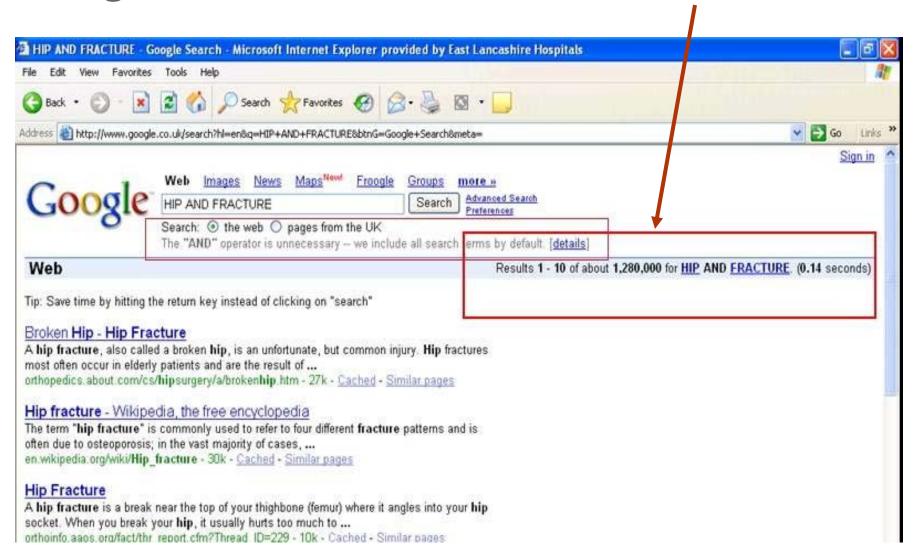

DRAW BACK 2- INFORMATION OVERLOAD, managing your search

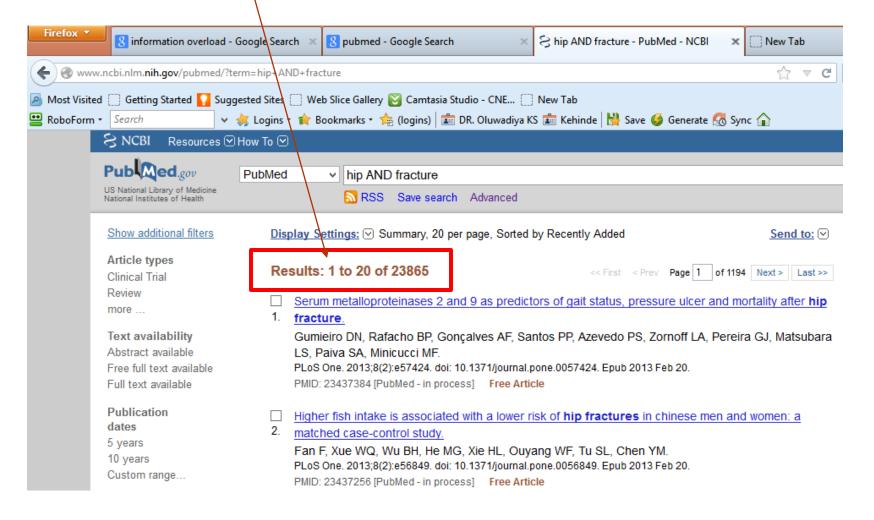

- Select website,
- Use filters/limits on search engines- age, sex, author, year, journal
- Specific key words
- Arrange in order of importance-the browser will follow you
- Boolean logic,
- Use quotation marks- for phrases
- You may need special search characters- truncators, wildcards etc

Example: hip fracture

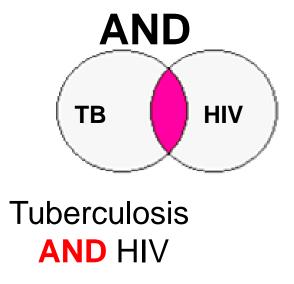

Google....Browses the whole internet....Lots of hits

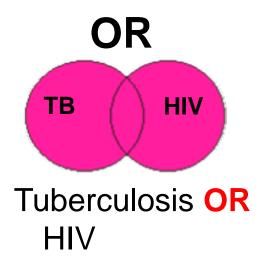

From PubMed....Browses medline...more focused results

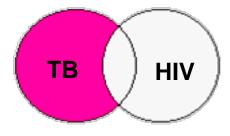

Boolean operators

NOT

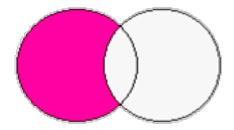

Tuberculosis NOT HIV

Boolean Operators: Caution

BE CAREFUL

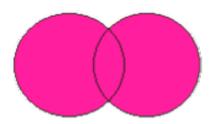

"NOT"

can weed out good resources

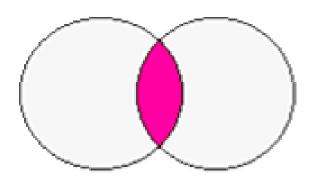

Boolean Operators: Caution DON'T GRAB IT ALL

"OR"
CAN BRING UP LOTS OF JUNKS

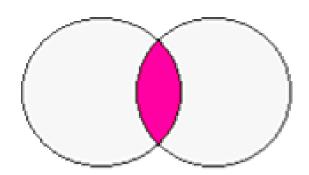

Boolean Operators: Caution WHEN IN DOUBT

USE "AND"

"AND" is the default operator used in PUBMED

Boolean Operators Hints

Think about other terms which mean the same i.e. synonyms, or related terms. Use "OR"

- ▶ Remember alternative spellings e.g. US vs British. Use "OR"
- ▶ For different key words, use "AND"

	AIID AIID			
	Paediatric*	Treatment	Developing world	OΒ
OR	Pediatric*	Therapy	3 rd World countries	
	Children			
	Children			

Advanced Searching Techniques -Tips

Truncation and missing characters, Wild Cards:

- * or \$ is inserted to find all alternative endings of a word
 - neoplas* neoplasm OR neoplastic OR neoplasia staph\$ will search for information on staphylococcus OR staphylococcal OR staphylococci
- ? can be used to substitute for a single letter anywhere in a word for alternatives
 - wom?n would search for "woman" and "women"

Advanced Searching Techniques - Tips

- "/" means all subheadings are searched
 - When a search term is entered, you can selectively choose some subheadings (such as pharmacology for pharmacology studies).
 - Subheadings are generally imprecise; accepting all subheadings increases the yield.
- "adj" cuts down on miscellaneous citations
 - "Heart adj failure" would find only instances in which "heart" is next to "failure."
- ".ti" or ".ab" searches in the title or abstract for the word of interest
 - Can find citations where the word you search for is not a keyword
- ".mp" or multiple posting a text word search; does not need to be a key word

DRAW BACK 3: Uncensored information

Consider the follow to select websites or information

- ☐ Branded VS Unbranded site
- ☐ Individual VS Organization or institution
- □ Dated VS Undated
- □ Daily updated VS Redundant or once yearly
- □ Referenced VS Unreferenced information
- ☐ Primary source VS "Secondary" or "Tertiary source"
- ☐ Provision of links to related sites VS No links, No contact info

DRAW BACK 4: Web based questionnaire

- Posers —sex posers, impostors, liars, multiple enteries difficult to manage
- Debriefing before collecting information difficult to manage
- Drop out rates- high , and you wont even know why
- Virus- major problem- may not affect your data directly but may disrupt the server→ ANTIVIRUS

DRAW BACK 5: Plagiarism – SO EASY

- ☐ In part cut and past and tie together- that's all
- ☐ In totality- get in another language- translate- put your signature paper is ready
- □ **Solution** Anti plagiarism software

Summary: you cannot fully achieve your potential as a researcher with out the net

Sky is the limit

- More than 5000 journals
- Thousands of book
- Millions of sites
- Unlimited resources
- More than 70 countries
- Generate own library

All In a few clicks!!!

This is just the hors d'oeuvre.

The main course is on its way

Thanks for your attention.
